## Flight Path Study - American Airlines Flight 11

### A. SUBJECT AIRCRAFT

Location:	New York City, NY
Date:	September 11, 2001
Time:	08:47 AM Eastern Daylight Time
Flight:	American Airlines Flight 11
Aircraft:	Boeing 767
NTSB#:	DCA01MA060

### B. GROUP

N/A

### C. SUMMARY

This document provides a brief description of the flight path of the aircraft based on information obtained from various sources of recorded radar of the subject aircraft both before and after the hijacking events. Flight paths are overlaid onto maps of the area, and time histories of altitude data are presented.

#### American Airlines Flight 11 – Flight Profile

The following profile of American Airlines Flight 11 is based on radar data obtained from the Federal Aviation Administration's Terminal and Air Route Traffic Control Centers, and from the U.S. Air Force 84<sup>th</sup> Radar Evaluation Squadron. Figure 1 shows the flight path of the aircraft from take off at Boston, MA to impact with the North tower of the World Trade Center in New York City. Figure 2 shows the aircraft's altitude profile for the 1 hour and 47 minute duration of the flight.

American Flight 11 took off from runway 4R at Boston's Logan Airport at approximately 8:00 AM (point A in Figures 1 and 2) and made a right turn to the West in response to ATC instructions. At 8:11 AM the airplane was passing through 21,500 ft. on a Westerly

heading, climbing at about 1,900 ft./minute to its initially assigned altitude of 29,000 ft. At 8:13:29, while passing through 26,000 ft., Boston Center instructed flight 11 to turn 20 degrees to the right. The crew acknowledged, and radar data shows a corresponding change in heading. Within the same minute, at 8:13:47 (point B), Boston Center instructed flight 11 to climb and maintain 35,000 ft. The crew never acknowledged this instruction, and over the next ten minutes the controller made numerous unsuccessful attempts to contact flight 11. At 8:24:38 an unknown voice was recorded on the ATC radio frequency stating "we have some planes just stay quiet and you'll be okay we are returning to the airport."

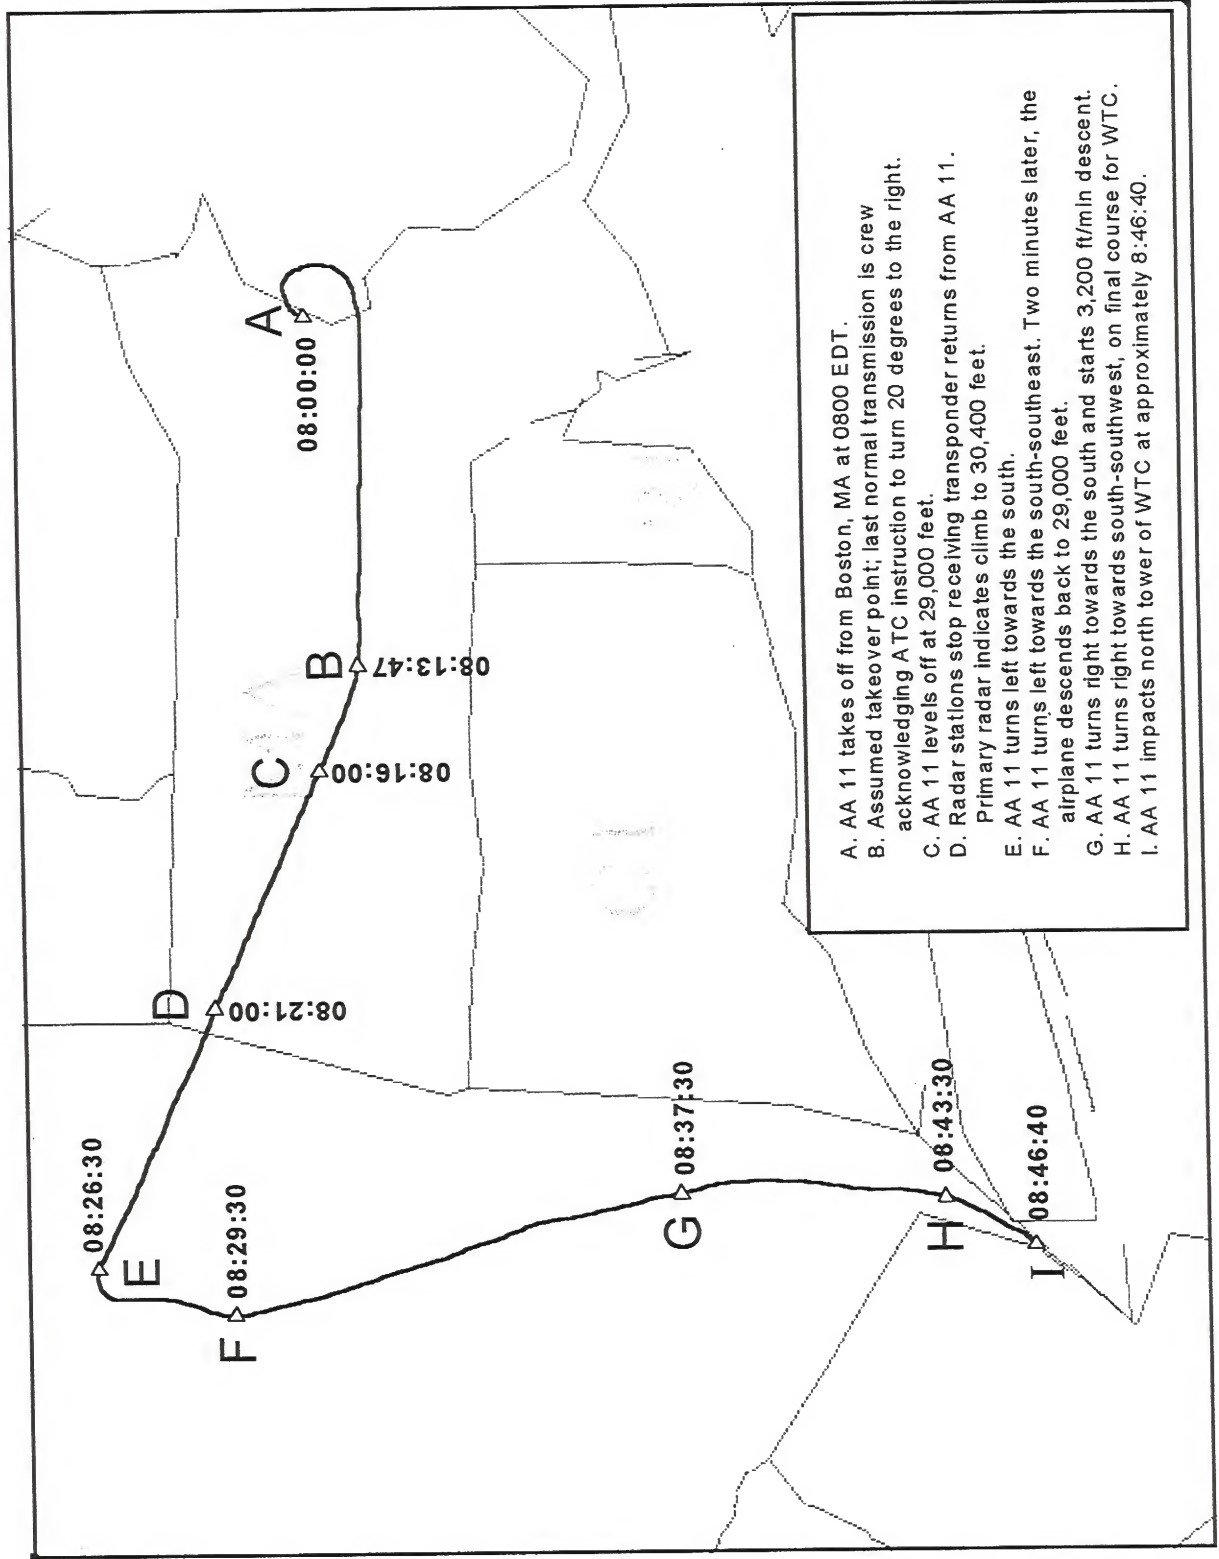

At about 8:16 AM (point C), radar data shows Flight 11 leveling off at 29,000 ft., the last assigned altitude acknowledged by the flight crew. At about 8:21 (point D) radar stations stop receiving transponder returns from the airplane. Since the transponder broadcasts the airplane's altitude to the radar station, precise information about the airplane's altitude is lost at this point. However, long range radar data obtained from the USAF includes (less precise) altitude information based on primary radar returns, and indicates that at about the same time the transponder returns ceased the airplane started a 1,500 ft. climb to 30,400 ft. The airplane maintained this altitude and the Northwest heading until about 8:26:30 (point E). At this point, the airplane made a level, left turn to the South. About a minute later it turned right to the South-Southwest, and about 2 minutes after that (at 8:29:30) it turned left to the South-Southeast (point F). At about 8:32 the airplane descended back to 29,000 ft., where it stayed until about 8:37:30 (point G). The airplane then started a descent at an average rate of about 3,200 feet/minute. About half a minute later while descending through 28,000 feet, flight 11 turned left to a more Southerly heading towards New York City.

At about 8:43:30 and 10,000 feet, the airplane made another left turn to the South-Southwest, its final heading for the World Trade Center (point H). The airplane impacted the North tower at approximately 8:46:40 (point I).
